

The GEN AI Program, by the Numbers

How much AI is in the cuts, how efficiently we're generating it, re-spin load, and where every shot stands. Read-only pull of the CTD Airtable · July 23, 2026.

33%

of each episode is AI footage

2.4:1

generate-to-use, from 5.1:1

0.66

re-spins / delivered shot

712

shots delivered to Cream

In one sentence. Generative AI reliably fills about a third of every episode, we're producing it more than twice as efficiently as when we started, re-spin churn has more than halved since episode 101, and just over half of all planned shots are already delivered.

AI in the cuts

Screen-time share per cut. Runtime = the timeline position of each cut's final AI clip, so these are floors.

CUT	CLIP S	SCREEN-TIME	RUNTIME	AI SHARE
101 Fine Cut +snap-ins	368	14:23	43:36	33%
102 Rough Cut 1	295	14:33	44:49	33%
103 Rough Cut	318	12:02	43:12	28%

A structural third of the show. The share holds at ~28–33% across three cuts and doesn't shrink as a cut matures — 101's locked fine cut carries *more* AI than its own earlier rough cut. 103 is lower only because it's a first assembly.

Efficiency — are we improving?

Clips generated per clip that lands in the cut. Lower is leaner.

EPISODE	GENERATED	IN CUT	GENERATE-TO-USE
101	1,879	368	5.1 : 1
102	872	295	3.0 : 1

103

774

318

2.4 : 1

Yes — sharply. The generate-to-use ratio has more than halved across three episodes: the same on-screen output for less than half the generation waste. Locked prompt library, reference-frame workflow, and re-spin discipline compounding.

Production pipeline

Every planned shot and every generated file, by status.

STAGE	COUNT	SHARE OF PLANNED SHOTS
● Sent to Cream	712	52%
● First request	106	8%
● In progress	69	5%
● Paused / unset	493	35%
Total planned shots	1,380	across all episodes

GENERATION	COUNT	NOTE
Total clips generated	3,990	~2.9 files per planned shot
Re-spin requests (all-time)	522	~0.66 per delivered shot lately
Currently open re-spins	142	rest re-spun and moved on

Re-spins

Delivered clips sent back for changes, measured against SHOTS DELIVERED — you can only re-spin something you delivered, and a generated-file denominator just rewards over-generation. Re-spin passes per shot sent to Cream.

EPISODE	RE-SPINS	DELIVERED	RE-SPINS / DELIVERED SHOT
101	251	159	1.58
102	110	167	0.66

103	145	220	0.66
101–103	506	546	0.93

STORY · HEAVIEST RE-SPIN LOAD	EP	RE-SPINS	
FDN — Fukushima	101	71	
447 — Air France 447	101	64	
HMB — Halifax	103	47	
CHF / TXC (tie)	101	34	
SDS — Sampoong	103	31	
MSH — Mount St. Helens	101	29	
CCS — Costa Concordia	103	27	

101 was the learning episode; 102 and 103 have settled. Churn ran 1.58 re-spin passes per delivered shot on 101 — the most rework while the pipeline was still finding its locks — then dropped to a flat 0.66 on both later episodes, less than half. Down and consistent, tracking the efficiency gain. FDN and 447 stay heaviest — effects-dense reactor and mid-air sequences where physics takes the most passes.

By episode

Everything lined up. Cut figures exist only where a cut is assembled (101–103).

EP	CUT STAGE	AI SHARE	GEN.	GEN-TO-USE	RE-SPIN/SHOT
101	Fine Cut	33%	1,879	5.1:1	1.58
102	Rough Cut 1	33%	872	3.0:1	0.66
103	Rough Cut	28%	774	2.4:1	0.66

1 0 4	Not assembled	—	<i>first-request heavy: MVE, TSF, MRB</i>
1 0 5	Not assembled	—	<i>first-request heavy: HSA, QIS</i>

Where the risk is. 104 and 105 carry the bulk of untouched first-request work and have no cut yet, so their AI share, efficiency and churn are unknown. If the curves hold they should run leaner than 101 — the numbers to watch.

Method & sources

AI share · AI clip durations per cut (GEN AI REPORTS) minus outdated/duplicate, over runtime from each cut's final Seq-Out timecode.

Efficiency · delivered files per episode's stories (GEN AI ASSETS) ÷ AI placements in that cut.

Re-spins · files with a re-spin note, per story, over shots at Sent-to-Cream status per episode.

Scope · 1,523 clip placements · 3,990 generated files · 522 re-spin requests · 546 delivered shots (101–103) · 1,380 planned shots. Runtime and placements-as-clips are floors.
